A stimulus to which the sleeper is accustomed may act as a disturbance. A more vivid imagination and a combination of senses may have the same effect.
Brain Potentials during Sleep

...rate as a result of appropriate disturbances; that is, the
...that types know. In contrast, other disturbances may
...appear on normal potentials made with the same stimulus.

The appearance of alpha waves after disturbance
a time when no movement or change in heart beat or respiration was noted. The pattern of electrical potentials, which are not likely to be associated with any unusual activity, shows a uniform pattern with a regular rhythm. Unfortunately we have been able to correlate a dream with the state of sleep in two instances.

In one case the sleeper was in the D stage of sleep, and the subject reported a dream of meeting a cut finger during a hospital visit. The subject also reported a dream of a hospital visit, but the pattern of electrical potentials was not consistent with any known state of sleep.
